

Booster Regulator/Air Tank

VBA/VBAT Series

Increase factory air pressure by up to 4 times!
Air-only operation requires no power supply,
reduces heat generation,
and allows easy installation.

RoHS

* Except the Chinese pressure vessel regulations compliant product (-X104)

No power supply or wiring needed

There is no need to install dedicated electrical wiring.

Easy installation

Simply install the unit in the air line. Requires far less space than installing the compressor.

Low heat generation

Very little heat is generated because no electricity is used, and there is no impact on cylinders, solenoid valves, etc.

Air-only operation

Operation is safe because no electricity is used.

Booster Regulator/VBA Series

Air Tank/VBAT Series

Booster Regulator *VBA Series*

Improved service life

- Floating piston structure
 - Grease retaining groove*
- * Except VBA10A, 11A

Doubled
that of the current model

Reduced noise

Reduced by **13 dB (A)**
compared with the current model

- Metal noise reduced by a bumper on the impact part of the switch valve
- Exhaust noise reduced by a high-noise reduction silencer

Improved reliability

Built-in mesh filter at IN port

- Prevents operation failure due to foreign matter.

Anti-condensation

Integrated air-feeding tube with the main tube

- Mitigates condensation caused by cooling during exhaust expansion.

Elbow silencer added* (Option)

Space saving when installed has been realized.

- * Except VBA2□A, 4□A

1/8" gauge ports

- Allows use of standard fittings for remote pressure monitoring, etc.
- * Gauge ports changed from 1/16" to 1/8" (VBA1□A, 2□A)

Air-operated type

Max. operating pressure 1.6 MPa

Fourfold pressure increase type

Air Tank *VBAT Series*

Perfect fit with a booster regulator

This is an air tank to which a booster regulator can be connected compactly. It can be used alone as a tank. The pressure vessel law is different from country to country, so as an air tank suitable to a country needs to be confirmed.

Extensive product lineup

To meet a variety of usage environment and pressure specifications, models are available in two materials, stainless steel 304 and carbon steel (SS400), and in four sizes ranging from 5 liters to 38 liters.

Model	VBAT05A	VBAT10A	VBAT20A	VBAT38A
Tank capacity (L)	5	10	20	38
Max. operating pressure (MPa)	2.0		1.0	
Material	Carbon steel			

Model	VBAT05S	VBAT10S	VBAT20S	VBAT38S
Tank capacity (L)	5	10	20	38
Max. operating pressure (MPa)	2.0			
Material	Stainless steel			

⚠ Caution

When used as a single unit (not connected with a booster regulator) and pressurized at over 1 MPa at normal temperatures, the air tank falls under the scope of the "High Pressure Gas Safety Act" in Japan.

Note 1) Be sure to secure an air supply capacity of the minimum operating pressure (0.1 MPa) or more.

Note 2) If the OUT pressure is higher than the set pressure by the knob, excess pressure is exhausted from the back of the knob.

Note 3) Flow rate at IN=OUT=0.5 MPa. The pressure varies depending on the operating conditions. Refer to "Flow Rate Characteristics" on pages 1276 and 1277.

Note 4) Set the pressure increase ratio to 2 or more.

Note 5) The tank connection port cannot be used for applications other than the connection with VBAT.

VBA Series

Solid line: Operating range

Operate so that the flow rate follows the solid line even when the outlet side air has been consumed.

Ex.) For the VBA10A: When the inlet pressure is 0.5 MPa and the set pressure is 1.0 MPa, operate at an outlet air flow rate of 180 L/min (ANR) or less.

Dotted line: Outside of the set pressure range

P₁: Inlet pressure P₂: Outlet pressure

VBA10A

Flow Rate Characteristics

VBA20A, 22A

Flow Rate Characteristics

VBA40A, 42A

Flow Rate Characteristics

When operated at a flow rate that falls within the unstable area (P₂ < P₁ conditions) as shown in the graphs above, the booster regulator may not operate normally and may therefore fail to increase the pressure.

Pressure Characteristics

Inlet pressure: 0.7 MPa
Outlet pressure: 1.0 MPa
Flow rate: 20 L/min (ANR)
(Representative value)

Pressure Characteristics

Inlet pressure: 0.7 MPa
Outlet pressure: 1.0 MPa
Flow rate: 20 L/min (ANR)
(Representative value)

Pressure Characteristics

Inlet pressure: 0.7 MPa
Outlet pressure: 1.0 MPa
Flow rate: 20 L/min (ANR)
(Representative value)

Charge Characteristics

(Pressure increase ratio: Twice)

Charge Characteristics

(Pressure increase ratio: Twice)

Charge Characteristics

(Pressure increase ratio: Twice)

VBA10A

• The time required to charge pressure in the tank from 0.7 MPa to 0.95 MPa at 0.5 MPa supply pressure:

$$\frac{P_2}{P_1} = \frac{0.7}{0.5} = 1.4 \quad \frac{P_2}{P_1} = \frac{0.95}{0.5} = 1.9$$

With the pressure increase ratio from 1.4 to 1.9, the charge time of 23 - 6 = 17 sec. (t) is given by the graph. Then, the charge time (T) for a 10 L tank:

$$T = t \times \frac{V}{10} = 17 \times \frac{10}{10} = 17 \text{ (s).}$$

VBA20A, 22A

• The time required to charge pressure in the tank from 0.8 MPa to 1.0 MPa at 0.5 MPa supply pressure:

$$\frac{P_2}{P_1} = \frac{0.8}{0.5} = 1.6 \quad \frac{P_2}{P_1} = \frac{1.0}{0.5} = 2.0$$

With the pressure increase ratio from 1.6 to 2.0, the charge time of 11.5 - 3.8 = 7.7 sec. (t) is given by the graph. Then, the charge time (T) for a 100 L tank:

$$T = t \times \frac{V}{10} = 7.7 \times \frac{100}{10} = 77 \text{ (s).}$$

VBA40A, 42A

• The time required to charge pressure in the tank from 0.8 MPa to 1.0 MPa at 0.5 MPa supply pressure:

$$\frac{P_2}{P_1} = \frac{0.8}{0.5} = 1.6 \quad \frac{P_2}{P_1} = \frac{1.0}{0.5} = 2.0$$

With the pressure increase ratio from 1.6 to 2.0, the charge time of 3.5 - 1.1 = 2.4 sec. (t) is given by the graph. Then, the charge time (T) for a 100 L tank:

$$T = t \times \frac{V}{10} = 2.4 \times \frac{100}{10} = 24 \text{ (s).}$$

Solid line: Operating range

Operate so that the flow rate follows the solid line even when the outlet side air has been consumed.

Ex.) For the VBA10A: When the inlet pressure is 0.5 MPa and the set pressure is 1.0 MPa, operate at an outlet air flow rate of 180 L/min (ANR) or less.

Dotted line: Outside of the set pressure range

P₁: Inlet pressure P₂: Outlet pressure

VBA43A

Flow Rate Characteristics

When operated at a flow rate that falls within the unstable area (P₂ < P₁ conditions) as shown in the graphs above, the booster regulator may not operate normally and may therefore fail to increase the pressure.

Pressure Characteristics

Inlet pressure: 0.7 MPa (Representative value)
Outlet pressure: 1.0 MPa
Flow rate: 20 L/min (ANR)

Charge Characteristics (Pressure increase ratio: Twice)

VBA43A

• The time required to charge pressure in the tank from 0.8 MPa to 1.0 MPa at 0.5 MPa supply pressure:

$$\frac{P_2}{P_1} = \frac{0.8}{0.5} = 1.6 \quad \frac{P_2}{P_1} = \frac{1.0}{0.5} = 2.0$$

With the pressure increase ratio from 1.6 to 2.0, the charge time of 4.5 - 1.3 = 3.2 sec. (t) is given by the graph. Then, the charge time (T) for a 100 L tank:

$$T = t \times \frac{V}{10} = 3.2 \times \frac{100}{10} = 32 \text{ (s)}$$

VBA11A

Flow Rate Characteristics

Pressure Characteristics

Inlet pressure: 0.6 MPa (Representative value)
Outlet pressure: 2.0 MPa
Flow rate: 10 L/min (ANR)

Charge Characteristics (Pressure increase ratio: Twice)

VBA11A

• The time required to charge pressure in the tank from 1.0 MPa to 1.5 MPa at 0.5 MPa supply pressure:

$$\frac{P_2}{P_1} = \frac{1.0}{0.5} = 2.0 \quad \frac{P_2}{P_1} = \frac{1.5}{0.5} = 3.0$$

With the pressure increase ratio from 2.0 to 3.0, the charge time of 147 - 58 = 89 sec. (t) is given by the graph. Then, the charge time (T) for a 10 L tank:

$$T = t \times \frac{V}{10} = 89 \times \frac{10}{10} = 89 \text{ (s)}$$

Pulsation/Pulsation is decreased with a tank.

If the outlet capacity is undersized, pulsation may occur.

VBAT05A

VBAT10A, 20A, 38A

Conditions:
Inlet pressure: 0.5 MPa
Outlet set pressure: 1 MPa
Flow rate: Between 0 and max. flow rate

- Performance of air tank
 - Alleviates the pulsation generated on the outlet side.
 - When air consumption exceeds air supply during intermittent operation, required air will be accumulated in the tank for use. This does not apply for continuous operation.
 - Operation at a flow rate that falls within the unstable area under temporary P₁ ≥ P₂ conditions can be prevented when the outlet side air has been consumed.

Sizing (Please use the **Booster Regulator Model Selection Software on the SMC website,**
<https://mssc.smcworld.com/brmss/>)

START

Provide requisite conditions for selection.

- Necessary conditions:**
Dc [mm]: Cylinder bore size
Lc [mm]: Cylinder stroke
N [pc.]: Number of cylinders
Tc [s]: Cylinder operating time
Dr [mm]: Piping bore (Valve-Cylinder)
Lt [mm]: Piping length (Valve-Cylinder)
C [cpm]: Operating frequency
P1 [MPa]: Booster regulator inlet pressure
P2 [MPa]: Booster regulator outlet pressure (Set pressure)
P3 [MPa]: Supply pressure for cylinder

Note 1) P3 is the necessary supply pressure to a cylinder, and set the pressure below the lower limit of pressure inside the tank with a regulator. Adjust the pressure taking the maximum operating pressure of equipment in use into consideration.
 Note 2) P2 is the output pressure of the booster regulator, which is also the upper limit of charge pressure to the tank.

- Other conditions:**
QAVE [L/min]: Average air flow rate
QMAX [L/min]: Maximum instantaneous air flow rate
K: Cylinder double-acting: 2, single-acting: 1
Ti [s]: Time to charge (Time to charge to P3)
T2 [s]: Time to charge (Time to charge to P2)
T [s]: Time to charge (Time to charge from P2 to P3)

Obtain the capacity (V).

Obtain the piping volume from the valve to the cylinder and the volume of the cylinder to obtain the air flow rate from the outlet side of the booster regulator.

Cylinder volume

$$V_{cyl} [L] = \frac{\pi \times D_c^2 \times L_c}{4 \times 10^6} \times \frac{P_3 + 0.101}{0.101} \times N$$

Piping capacity

$$V_{tube} [L] = \frac{\pi \times D_r^2 \times L_t}{4 \times 10^6} \times \frac{P_3}{0.101} \times N$$

Selection example			
Dc [mm]:	100	Lt [mm]:	500
Lc [mm]:	100	C [cpm]:	10
N [pc.]:	1	P1 [MPa]:	0.5
Tc [s]:	0.5	P2 [MPa]:	1.0
Dr [mm]:	10	P3 [MPa]:	0.8

$$V_{cyl} [L] = \frac{\pi \times 100^2 \times 100}{4 \times 10^6} \times \frac{0.8 + 0.101}{0.101} \times 1 = 7.0 [L]$$

$$V_{tube} [L] = \frac{\pi \times 10^2 \times 500}{4 \times 10^6} \times \frac{0.8}{0.101} \times 1 = 0.3 [L]$$

Calculate air flow rate (Q).

Obtain the average air flow rate QAVE to select the size of the booster regulator.

Average air flow rate

$$Q_{AVE} [L/min (ANR)] = (V_{cyl} + V_{tube}) \times K \times C$$

(Reciprocation)

Obtain the maximum instantaneous air flow rate QMAX to check the necessity of an air tank.

Maximum instantaneous air flow rate

$$Q_{MAX} [L/min (ANR)] = \frac{(V_{cyl} + V_{tube})}{T_c} \times 60$$

$$Q_{AVE} [L/min (ANR)] = (7.0 + 0.3) \times 2 \times 10 = 146 [L/min (ANR)]$$

$$Q_{MAX} [L/min (ANR)] = \frac{(7.0 + 0.3)}{0.5} \times 60 = 877 [L/min (ANR)]$$

Select the booster regulator and check the necessity of an air tank.

Select the booster regulator from the average air flow rate QAVE and check the necessity of an air tank from the maximum instantaneous air flow rate QMAX.

It can be used when the outlet air flow rate of the intersecting point between the booster regulator inlet pressure (P1) and outlet pressure (cylinder supply pressure, P2) on the catalog flow characteristic table (p. 1276, 1277) is equal to the average air flow rate QAVE or higher.
An air tank is required when the outlet air flow rate is less than the maximum instantaneous air flow rate QMAX.
An air tank is not required when the outlet air flow rate is at the maximum instantaneous air flow rate QMAX or higher.

⚠ Caution

- Set the pressure increase ratio of the VBA11A (pressure increase ratio 4) to 2 or more. As a malfunction may occur when operated at a pressure increase ratio of 2 times or less, operate at a pressure increase ratio of 2 (VBA10, VBA20A, etc.).
- Since the booster regulator is a compressor powered by the air, it consumes the air. The air consumption is approximately 1.2 times (pressure increase ratio 2) or 3.7 times (pressure increase ratio 4) larger than the outlet side volume. Therefore, the booster regulator requires a supply capacity of the inlet side volume that is approximately 2.2 times (pressure increase ratio 2) or 4.7 times (pressure increase ratio 4) larger than the outlet side volume.

Selection example

P₁: 0.5 (MPa), P₂: 0.8 (MPa)

Average air flow rate Q_{AVE}: 146 (L/min)

Maximum instantaneous air flow rate Q_{MAX}: 877 (L/min)

Outlet air flow rate
VBA10A: 110 (L/min)
VBA20A: 580 (L/min)
VBA40A: 1,050 (L/min)

VBA10A

Flow Rate Characteristics

VBA20A, 22A

Flow Rate Characteristics

VBA40A, 42A

Flow Rate Characteristics

Fig. 1 Flow Rate Characteristics

Results

• **VBA10A: Cannot be used**

(The outlet air flow rate is less than the average air flow rate Q_{AVE}.)

• **VBA20A: Can be used (air tank required)**

(The outlet air flow rate is at the average air flow rate Q_{AVE} or higher and less than the max. instantaneous air flow rate Q_{MAX}.)

• **VBA40A: Can be used**

(The outlet air flow rate is at the average air flow rate Q_{AVE} or higher and at the max. instantaneous air flow rate Q_{MAX} or higher.)

Fig. 2 Booster regulator selection and air tank necessity confirmation results

Obtain the air tank capacity.

Obtain the air tank capacity.

$$V [L] = \frac{Q_{MAX}}{(P_2 - P_1) \times 9.9} \times \frac{T_c}{60} \times K$$

Check the air tank charge characteristics.

Obtain the time T from the catalog charge characteristics table (p. 1276, 1277) and check that it satisfies the operating frequency.

$$T = \left(\frac{V}{10}\right) \times (T_2 - T_1) \leq \frac{60}{C}$$

Application example

$$T = \left(\frac{7.4}{10}\right) \times (11.5 - 3.8) = 5.7 \leq \frac{60}{10}$$

A tank smaller than the calculation results may satisfy the requirement since this size selection calculation provides calculation which is on the safe side. This does not consider air flowing from the booster regulator. Please use the booster regulator model selection software on the SMC website.

Application example

Required air tank volume for **VBA20A**

$$V [L] = \frac{877}{(1.0 - 0.8) \times 9.9} \times \frac{0.5}{60} \times 2 = 7.4 [L]$$

* Air tank of 7.4 L or more is required.

VBA20A, 22A

Charge Characteristics

(Pressure increase ratio: Twice)

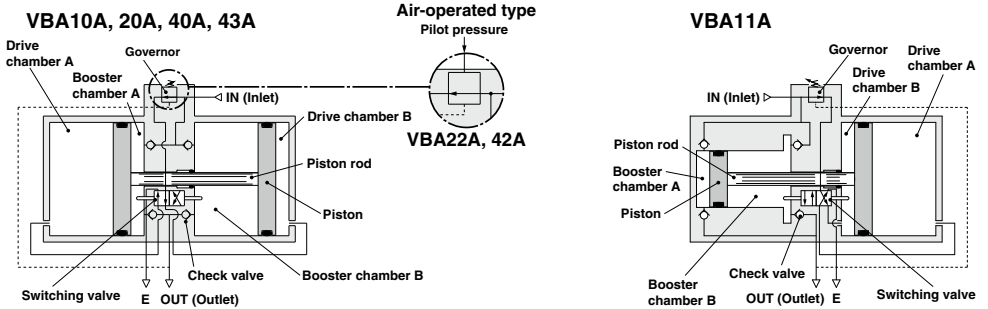

END

When running continuously for longer periods of time, confirm the life expectancy. When the life expectancy is shorter than required, select a larger sized booster regulator.

VBA Series

Working Principle

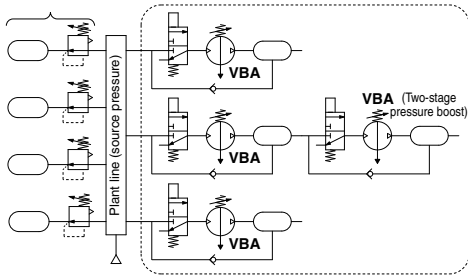

The IN air passes through the check valve to **booster chamber A and B**. Meanwhile, air is supplied to **drive chamber B** via the governor and the switching valve. Then, the air pressure from **drive chamber B** and **booster chamber A** are applied to the piston, boosting the air in **booster chamber B**. As the piston travels, the boosted air is pushed via the check valve to the OUT side. When the piston reaches to the end, the piston causes the switching valve to switch, so that **drive chamber B** is in the exhaust state and **drive chamber A** is in the supply state respectively. Then, the piston reverses its movement, this time, the pressures from **booster chamber B** and **drive chamber A** boosts the air in **booster chamber A** and sends it to the OUT side. The process described above is repeated to continuously supply highly pressurized air from the IN to the OUT side. The governor establishes the outlet pressure by knob operation and pressure adjustment in the drive chamber by feeding back the outlet pressure.

Circuit Example

- When only some of the machines in the plant require high-pressure air, booster regulators can be installed for only the equipment that requires it. This allows the overall system to use low-pressure air while accommodating machines requiring high-pressure air.

General line (low pressure) Locations requiring high pressure

- When using two booster regulators for 2-stage pressure boost, be sure to supply sufficient flow to each booster regulator in order to stabilize the booster regulator inlet pressure. Refer to Selection 2. on page 1281 for the inlet side supply amount.

- When the actuator output is insufficient but space limitations prohibit switching to a larger cylinder diameter, a booster regulator can be used to increase the pressure. This makes it possible to boost the output without replacing the actuator.
- When a certain level of output is required but the cylinder size must be kept small so that the driver remains compact.

- When only one side of the cylinder is used for work, booster regulators can be installed only on the lines that require them to reduce the overall air consumption volume.

Design

⚠ Warning

1. Warning concerning abnormal outlet pressure

- If there is a likelihood of causing an outlet pressure drop due to unforeseen circumstances such as equipment malfunction, thus leading to a major problem, take safety measures on the system side.
- Because the outlet pressure could exceed its set range if there is a large fluctuation in the inlet pressure, leading to unexpected accidents, take safety measures against abnormal pressures. If operation at a flow rate that falls within the unstable area ($P_1 \geq P_2$) occurs due to outlet pressure consumption, install an air tank, etc. (Refer to page 1277.)
- Operate the equipment within its maximum operating pressure and set pressure range.

2. Residual pressure measures

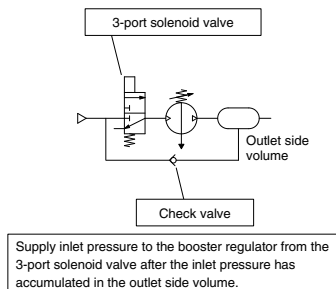

- Connect a 3-port valve to the OUT side of the booster regulator if the residual pressure must be released quickly from the outlet pressure side for maintenance, etc. (Refer to the diagram below.) The residual outlet pressure side cannot be released even if the 3-port valve is connected to the IN side because the check valve in the booster regulator will activate.

- After operation is finished, release the supply pressure at the inlet. This stops the booster regulator from moving needlessly and prevents operating malfunctions.
- When stopping the booster regulator, after the pressure has risen, exhaust the pressure starting from the inlet side, and then stop the product.

- If operated so that the inlet pressure and outlet pressure are exhausted every operational cycle, the flow rate will occasionally fall within the unstable area shown in the Flow Rate Characteristics graphs on pages 1276 and 1277, resulting in the switching valve stopping halfway and failing to increase the pressure. (The restart method is shown on page 1283.)
- When exhausting inlet pressure or outlet pressure (residual pressure), supply inlet pressure to the booster regulator after supplying the inlet pressure to the outlet side volume.

Recommended air circuit

Design

⚠ Caution

1. System configuration

- Be sure to secure an air supply capacity of the minimum operating pressure (0.1 MPa) or more. If the internal operating pressure becomes the minimum operating pressure or less, the switching valve may remain in the intermediate position, which may cause a restart failure.
- The IN port of the booster regulator has metallic mesh to prevent dust from entering the booster regulator. However, it cannot remove dust continuously or separate drainage. Make sure to install a mist separator (AM series) on the inlet side of the booster regulator.
- The booster regulator has a sliding part inside, and it generates dust. Also, install an air purification device such as an air filter or a mist separator on the outlet side as necessary.
- Connect a lubricator to the outlet side.
If a lubricator is connected to the inlet side, oil will accumulate on the sliding parts of the switching valve in the booster regulator, which may result in increased sliding resistance and the malfunction of the product.

2. Exhaust air measures

- Provide a dedicated pipe to release the exhaust air from each booster regulator. If centralized piping is used for the exhaust air, the switching valve may stop halfway and fail to increase the pressure due to the influence of other exhaust.
In the same manner, if a silencer or exhaust cleaner other than those designated by SMC is used, back pressure will be generated due to the clogging of the silencer, which may result in the switching valve stopping halfway and failing to increase the pressure.
- Depending on the necessity, install a silencer or an exhaust cleaner on the exhaust port of the booster regulator to reduce the exhaust noise.

3. Maintenance space

- Allow the sufficient space for maintenance and inspection.

Selection

⚠ Caution

1. Check the specifications.

- Consider the operating conditions and operate this product within the specification range that is described in this catalog.

2. Selection

- Based on the conditions (such as pressure, flow rate and cycle time) required for the outlet side of the booster regulator, check the selection procedures described in this catalog or model selection software for size selection of the booster regulator. Model selection can be done using the selection software on the SMC website. Go to Documents/Downloads → Model Selection Software → Booster Regulators
- Since the booster regulator is a compressor powered by the air, it consumes the air. The air consumption is approximately 1.2 times (pressure increase ratio 2) or 3.7 times (pressure increase ratio 4) larger than the outlet side volume. Therefore, the booster regulator requires a supply capacity of the inlet side volume that is approximately 2.2 times (pressure increase ratio 2) or 4.7 times (pressure increase ratio 4) larger than the outlet side volume.
- Set the pressure of the VBA10A, VBA20A, VBA22A, VBA40A, VBA42A or VBA43A (pressure increase ratio 2) to a level that is at least 0.1 MPa higher than the inlet pressure. If the pressure differential is 0.1 MPa or less, the internal operating pressure becomes the minimum operating pressure or less and the switching valve may remain at the intermediate position, causing a restart failure.
- Set the pressure increase ratio of the VBA11A (pressure increase ratio 4) to 2 or more. When the VBA11A is used at a pressure increase ratio of 2 or less, the internal operating pressure becomes the minimum operating pressure or less and the switching valve may remain at the intermediate position, causing a restart failure.
- When operating the booster regulator continuously for longer periods of time, particularly confirm its service life.
- The service life of the booster regulator depends on not the operation hours but the operating cycles (piston sliding distance). The operating cycles (piston sliding distance) depend on the outlet flow of the booster regulator. Thus, when more outlet flow of the booster regulator is used, its service life becomes shorter. Selecting a booster regulator of a larger size will result in reduced operation frequency, thus increasing the service life of the product.
- When using two booster regulators for 2-stage pressure boost, be sure to provide a stable supply of pressure to the downstream booster regulator, and install a pressure vessel such as an air tank, etc., between the booster regulators. (Refer to the circuit diagram shown on page 1280.)

Mounting

⚠ Caution

1. Transporting

- When transporting this product, hold it lengthwise with both hands. Never hold it by the black knob that protrudes from the center because the knob could become detached from the body, causing the body to fall and leading to injury.

2. Installation

- Install this product so that the silver-colored tie-rods and cover are placed horizontally. If mounted vertically, it may result in a malfunction.
- Because the piston cycle vibration is transferred, use the following mounting bolts (VBA1: M5; VBA2, 4: M10) and tighten them with the specified torque (VBA1: 3 N·m; VBA2, 4: 24 N·m).
- If the transmission of vibration is not preferred, insert an isolating rubber material before installation.
- Mount the pressure gauge with a torque of 7 to 9 N·m.

Piping

⚠ Caution

1. Flushing

- Use an air blower to flush the piping to thoroughly remove any cutting chips, cutting oil, or debris from the piping inside, before connecting them. If they enter the inside of the booster regulator, they could cause the booster regulator to malfunction or its durability could be affected.

2. Piping size

- To bring the booster regulator's ability into full play, make sure to match the piping size to the port size.

Air Supply

⚠ Caution

1. Quality of air source

- Connect a mist separator to the inlet side near the booster regulator. If the quality of the compressed air is not thoroughly controlled, the booster regulator could malfunction (without being able to boost) or its durability could be affected.
- If dry air (atmospheric pressure dew point: -23°C or less) is used, the life expectancy may be shortened because dry air will accelerate evaporation of grease inside.

2. Pressure fluctuation

- Provide a stable supply of pressure for the inlet pressure. If the inlet pressure supply is unstable, operation also becomes unstable, which may result in the switching valve stopping halfway and failing to increase the pressure.
- When starting up the compressor, be sure to wait for the pressure to stabilize at the min. operating pressure (0.1 MPa) or higher before supplying air so that pressure less than the min. operating pressure isn't being supplied to the booster regulator.

Operating Environment

⚠ Caution

1. Installation location

- Do not install this product in an area that is exposed to rainwater or direct sunlight.
- Do not install in locations influenced by vibrations. If it must be used in such an area due to unavoidable circumstances, please contact SMC beforehand.

Handling

⚠ Caution

1. Setting the pressure on the knob-operated type

- If air is supplied to the product in the shipped state, the air will be released. Set the pressure by quickly pulling up on the governor knob, releasing the lock, and rotating the knob in the direction of the arrow (+).
- There is an upper and lower limit for the knob rotation. If over-rotating the knob even after reaching to the limit, the internal parts may be damaged. If the knob suddenly feels heavy while being turned, stop turning the knob.
- Once the setting is completed, push the knob down and lock it.
- To decrease the outlet pressure, after the pressure has been set, rotate the knob in the direction of the arrow (-). The residual air will be released from the area of the knob, due to the relief construction of the governor.
- To reset the pressure, first reduce the pressure so that it is lower than the desired pressure; then, set it to the desired pressure.

2. Setting the pressure on the air-operated type (VBA22A, 42A)

- Connect the outlet pipe of the pilot regulator for the remote control to the pilot port (P). (Refer to the diagram below.)
- Refer to the graph below for the relationship between the pilot pressure and outlet pressure.
- The AR20 and AW20 are recommended for the pilot regulator.

Pilot regulator

- The outlet pressure is twice the pilot pressure.
- When the inlet pressure is 0.4 MPa:

Pilot pressure
0.2 MPa to 0.4 MPa
Outlet pressure
0.4 MPa to 0.8 MPa

Handling

⚠ Caution**3. Draining**

- If this product is used with a large amount of drainage accumulated in the filter, mist separator or tank, the drainage could flow out, leading to equipment malfunction. Therefore, drain the system once a day. If it is equipped with an auto drain, check its operation once a day.

4. Exhaust

- If the air on the OUT side is not consumed for a long period of time when the pressure increase ratio is set to 2 or less, there may be delays in the left and right switching operation of the piston, which may result in air leakage from the exhaust port. This phenomenon is not considered abnormal. The leak will stop once the air on the OUT side is consumed.

5. Maintenance**Booster regulator**

- Life expectancy varies depending on the quality of air and the operating conditions. Signs that the unit is reaching the end of its service life include the following:
 - Constant bleed from under the knob.
 - Air exhaust noise can be heard from the booster regulator at 10 to 20 second intervals even when there is no air consumption on the outlet side.
 Conduct maintenance earlier than scheduled in such cases.
- When maintenance is required, confirm the model and lot number of the booster regulator, and please contact SMC for maintenance kit.
- Conduct maintenance according to the specified maintenance procedure by individuals possessing enough knowledge and experiences in maintaining pneumatic equipment.
- The list of replacement parts and kit number are shown on page 1284, and the figure shows the position of the parts.

Silencer

It is normal for the silencer to change in color due to the turbine oil, grease, and drain contained in the exhaust, the surrounding atmosphere, etc. Back pressure will be generated if the silencer is clogged, which may result in the switching valve stopping halfway and failing to increase the pressure; therefore, be sure to perform regular maintenance on the product.

6. Restart method when the pressure will not increase

- With the inlet side in a pressurized state, use your finger, a finger valve, etc., to block the exhaust port, let the exhaust pressure rise, and then quickly release it.
- Release inlet and outlet pressure air and, after confirming the safety of the downstream devices, resupply the air.

Made to Order

Made to Order For detailed dimensions, specifications and lead times, please contact SMC.

1 Copper-free/Fluorine-free

The inner or outer copper parts material has been changed to stainless steel or aluminum. The fluorine resin parts has been changed to general resin.

20 — Standard model no.

- Made to Order
Copper-free/Fluorine-free
(Excludes models with a pressure gauge (Option))

* This option cannot be selected for air tank with safety valve.

1286

2 CE/UKCA explosion-proof directive (ATEX) compliant

56 — Standard model no.

- Made to Order
CE/UKCA explosion-proof directive (ATEX): Category 3GD

3 Ozone resistant

Ozone resistance is strengthened through the use of fluororubber (diaphragm) and hydrogenated NBR (valve, rod seal) for the rubber parts of the seal material.

80 — Standard model no.

- Made to Order
Ozone resistant

* Weather resistant NBR (diaphragm) and hydrogenated NBR (valve) are used for the rubber parts of the standard model.

Air Tank VBAT Series

RoHS

* Except the Chinese pressure vessel regulations compliant product (-X104)

Made to Order
(For details, refer to page 1291.)

How to Order

- Compact connections are possible with booster regulators.
- It can be used alone as a tank.
- Also partially compatible with overseas standards

VBAT05A1

VBAT10S1

VBAT20S1

VBAT38A1

Caution

When used as a single unit (not connected with a booster regulator) and pressurized at over 1 MPa at normal temperatures, the air tank falls under the scope of the "High Pressure Gas Safety Act" in Japan.

Weight [kg]	4.5/3.2	9.1/8.2	15.0/13.2	20.9/20.4
Material	VBAT□□A□1	Carbon steel <small>Note 1)</small> SA-414 (Plug for inspection port is made of carbon steel.)		
	VBAT□□S□1	Stainless steel SA-240 316 (Plug for inspection port is made of stainless steel.)		
Paint	VBAT□□A□1	Outside: Silver gray, Inside: Phosphate coated treatment		
Surface treatment	VBAT□□S□1	Outside: Acid cleaning <small>Note 2)</small>		
Documents included	• Manufacturer's certificate of compliance • Operation manual			
Included parts	• Safety valve • Accessory kit			

Note 1) Rust may occur in the air tank (carbon steel). It can be removed by installing an air filter (AF series) on the OUT port of the air tank. If the presence of rust may cause problems, we recommend selecting the stainless steel specification.

Note 2) There may be scratches, rubbing, stains, or discoloration on the surface of the product which do not affect its function or performance. The external appearance of the welded portion may also vary, but this does not affect the performance of the product.

Specific Product Precautions

Be sure to read this before handling the products.
Refer to page 9 for safety instructions.

Design

⚠ Warning

1. Operating pressure

- Operate this product below the maximum operating pressure. If it is necessary, take appropriate safety measures to ensure that the maximum operating pressure is not exceeded.

● When the tank alone is used

Use a pressure switch or a safety valve to ensure that the maximum operating pressure is not exceeded.

2. Connection

- The air tank (carbon steel) port portion (including the seal surface) and the mounting screws are untreated.

Rust may occur on these untreated parts as well as the inner surface of the tank.

If the generation of rust must be avoided, please consider selecting the stainless steel specification.

- Be sure to air blow (flush) the inside of the air tank before use. Dust or oil may flow out to the outlet side. After conducting air blow (flushing), install an air filter (AF series), etc., on the OUT port of the air tank.
- A VBA booster regulator can be connected directly with the tank accessories as indicated combinations below.

Selection

⚠ Caution

- Consider the operating conditions and operate this product within the specification range.
- When using the air tank with a booster regulator, refer to "Sizing" on page 1278 or SMC Pneumatic System Energy Saving Program.

Mounting

⚠ Caution

1. Accessories

- Refer to the operation manual regarding combining booster regulators with older model air tanks.
- The accessories are secured by bands to the feet of the air tank. Once removed, make sure not to lose them.

2. Installation

- Install the tank away from people. It is dangerous if the accumulated air inside the tank were to seep out.
- Do not mount the air tank on a moving part or a place with vibration. If it must be used in such an area due to unavoidable circumstances, please contact SMC beforehand.
- When connecting a booster regulator with the tank, refer to the operation manual first, which is provided with the air tank before assembling.
- To mount the air tank on a floor surface, use the four holes to secure the tank with bolts or anchor bolts.
- Put measures into place to prevent load and vibrations from the piping from being applied to the air tank.

Maintenance

⚠ Warning

1. Inspection

- The use of pressure vessels could lead to an unexpected accident due to external damage or internal corrosion caused by drainage. Therefore, make sure to check periodically for external damage, or the extent of internal corrosion through the port hole. An ultrasonic thickness indicator may also be used to check for any reduction in material thickness.

2. Draining

- If this product is used with a large amount of drainage, the drainage could flow out, leading to equipment malfunction or corrosion inside the tank. Therefore, drain the system once a day.
